

**Practice Exam 3 solutions**

1. Find the (rectangular) equation of the line tangent to the graph of the polar curve

$$r = 3 \sin \theta - \cos(3\theta)$$

at the point where  $\theta = \frac{\pi}{4}$ .

$r = 3 \sin \theta - \cos(3\theta) = f(\theta)$ , so

$x = r \cos \theta = f(\theta) \cos \theta$  and  $y = r \sin \theta = f(\theta) \sin \theta$ , so

$$dy/dx = \frac{dy/d\theta}{dx/d\theta} = \frac{f'(\theta) \sin \theta + f(\theta) \cos \theta}{f'(\theta) \cos \theta - f(\theta) \sin \theta}.$$

But  $f'(\theta) = 3 \cos \theta + 3 \sin(3\theta)$ , so

$f'(\pi/4) = 3 \cos(\pi/4) + 3 \sin(3\pi/4) = 3(\sqrt{2}/2) + 3(-\sqrt{2}/2) = 0$ , and

$f(\pi/4) = 3 \sin(\pi/4) - \cos(3\pi/4) = 3(\sqrt{2}/2) - (-\sqrt{2}/2) = 4(\sqrt{2}/2) = 2\sqrt{2}$ .

and since  $\sin(\pi/4) = \cos(\pi/4) = \sqrt{2}/2$ , we have, at  $\theta = \pi/4$ ,

$$\begin{aligned} dy/dx &= \frac{f'(\pi/4) \sin(\pi/4) + f(\pi/4) \cos(\pi/4)}{f'(\pi/4) \cos(\pi/4) - f(\pi/4) \sin(\pi/4)} = \frac{(0)(\sqrt{2}/2) + (2\sqrt{2})(\sqrt{2}/2)}{(0)(\sqrt{2}/2) - (2\sqrt{2})(\sqrt{2}/2)} \\ &= \frac{(2\sqrt{2})(\sqrt{2}/2)}{-(2\sqrt{2})(\sqrt{2}/2)} = -1. \end{aligned}$$

So the slope of the tangent line is  $-1$ , and it goes through the point

$(x, y) = (f(\pi/4) \cos(\pi/4), f(\pi/4) \sin(\pi/4)) = ((2\sqrt{2})(\sqrt{2}/2), (2\sqrt{2})(\sqrt{2}/2)) = (2, 2)$ ,

so the equation for the tangent line is  $y - 2 = (-1)(x - 2)$ , or  $y = -x + 4$ .

2. Find the length of the polar curve  $r = \theta^2$  from  $\theta = 0$  to  $\theta = 2\pi$ .

For  $r = \theta^2 = f(\theta)$ , since

$$(dx/d\theta)^2 + (dy/d\theta)^2 = (f(\theta))^2 + (f'(\theta))^2 = (\theta^2)^2 + (2\theta)^2 = \theta^4 + 4\theta^2 = \theta^2(\theta^2 + 4),$$

we have

$$\begin{aligned} \text{Length} &= \int_0^{2\pi} \sqrt{\theta^2(\theta^2 + 4)} d\theta = \int_0^{2\pi} \sqrt{\theta^2} \sqrt{\theta^2 + 4} d\theta \\ &= \int_0^{2\pi} |\theta| \sqrt{\theta^2 + 4} d\theta = \int_0^{2\pi} \theta \sqrt{\theta^2 + 4} d\theta \end{aligned}$$

Setting  $u = \theta^2 + 4$ , then  $du = 2\theta d\theta$ , and for

$\theta = 0$ ,  $u = 4$ , while for  $\theta = 2\pi$ ,  $u = 4\pi^2 + 4$ , so

$$\begin{aligned} \text{Length} &= \frac{1}{2} \int_4^{4\pi^2+4} \sqrt{u} du = \left( \frac{1}{2} \right) \left( \frac{2}{3} \right) u^{3/2} \Big|_4^{4\pi^2+4} \\ &= \frac{1}{3} ((4\pi^2 + 4)^{3/2} - 4^{3/2}) = \frac{8}{3} ((\pi^2 + 1)^{3/2} - 1) \end{aligned}$$

3. Find the area inside of the graph of the polar curve

$$r = \sin(\theta) - \cos(\theta)$$

from  $\theta = \frac{\pi}{4}$  to  $\theta = \frac{5\pi}{4}$ .

[Extra credit: What does this curve look like? (Hint: multiply both sides by  $r$ .)]

Since  $\text{Area} = \int \frac{1}{2} (f(\theta))^2 d\theta$ , we have

$$\begin{aligned} \text{Area} &= \frac{1}{2} \int_{\pi/4}^{5\pi/4} (\sin \theta - \cos \theta)^2 d\theta = \frac{1}{2} \int_{\pi/4}^{5\pi/4} \sin^2 \theta - 2 \sin \theta \cos \theta + \cos^2 \theta d\theta \\ &= \frac{1}{2} \int_{\pi/4}^{5\pi/4} 1 - 2 \sin \theta \cos \theta d\theta = \frac{1}{2} \int_{\pi/4}^{5\pi/4} 1 - \sin(2\theta) d\theta = \frac{1}{2} \left[ \theta + \frac{1}{2} \cos(2\theta) \right] \Big|_{\pi/4}^{5\pi/4} \\ &= \frac{1}{2} \left[ \left( 5\pi/4 + \frac{1}{2} \cos(5\pi/2) \right) - \left( \pi/4 + \frac{1}{2} \cos(\pi/2) \right) \right] = \frac{1}{2} \left[ \left( 5\pi/4 + \frac{1}{2} \right) - \left( \pi/4 + \frac{1}{2} \right) \right] \\ &= \frac{1}{2} [(5\pi/4) - (\pi/4)] = \frac{1}{2} [\pi] = \frac{\pi}{2} \end{aligned}$$

To see what this curve is, we have  $r = \sin(\theta) - \cos(\theta)$ , so  $r^2 = r \sin(\theta) - r \cos(\theta)$ , so  $x^2 + y^2 = y - x$ , so  $(x^2 + x) + (y^2 - y) = 0$ , so  $(x^2 + x + \frac{1}{4}) + (y^2 - y + \frac{1}{4}) = \frac{1}{4} + \frac{1}{4} = \frac{1}{2}$ , so  $(x + \frac{1}{2})^2 + (y - \frac{1}{2})^2 = \frac{1}{2} = (\frac{1}{\sqrt{2}})^2$

This is a circle, centered at  $(-\frac{1}{2}, \frac{1}{2})$ , with radius  $\frac{1}{\sqrt{2}}$  !

4. Find the orthogonal projection of the vector  $\vec{v} = (3, 1, 2)$  onto the vector  $\vec{w} = (-1, 4, 2)$  .

The orthogonal projection of  $\vec{v}$  onto  $\vec{w}$  is

$$\begin{aligned} \frac{\vec{v} \bullet \vec{w}}{\vec{w} \bullet \vec{w}} \vec{w} &= \frac{(3, 1, 2) \bullet (-1, 4, 2)}{(-1, 4, 2) \bullet (-1, 4, 2)} (-1, 4, 2) = \frac{-3 + 4 + 4}{1 + 16 + 4} (-1, 4, 2) \\ &= \frac{5}{21} (-1, 4, 2) = \left( -\frac{5}{21}, \frac{20}{21}, \frac{10}{21} \right) \end{aligned}$$

5. Find the parametric equation of the line through the points

$(1, 2, 3)$  and  $(-1, 3, 4)$

The direction vector for the line points from  $(1, 2, 3)$  to  $(-1, 3, 4)$  (or the reverse!), so we may take  $\vec{v} = \langle -1 - 1, 3 - 2, 4 - 3 \rangle = \langle -2, 1, 1 \rangle$ .

So a parametric equation for the line is given by

$$\vec{r}(t) = \langle 1, 2, 3 \rangle + t \langle -2, 1, 1 \rangle = \langle 1 - 2t, 2 + t, 3 + t \rangle .$$
